ARVIONIQS

GOVERNED INTELLIGENCE · AUTHORISED ACTION

ARVIONIQS FOR DEFENCE

Every decision.
Backed by evidence.

Keep the agreed facts visible.
Make changes traceable.
Keep authority with your people.

DEFENCE WORKFLOW CONCEPT

A CLEARER RECORD. A MORE INFORMED REVIEW.

Record / company memory
Links agreements, supplier documents and decisions to their source and approval history.

Verify / AI engineering oversight
Checks AI coding-agent delivery claims against recorded activity and code history.

SIX REASONS TO PUT EVIDENCE FIRST

01 Trace the source
Open the source quotation behind a fact. Review the evidence without rebuilding the story from emails.

02 Protect agreed facts
A new claim cannot silently replace a locked fact. Conflicts go to review; both versions remain visible.

03 Retain human authority
AI proposes. A named, authorised reviewer accepts, edits or rejects what becomes the agreed record.

04 Preserve decision history
Keep what changed, who approved it and why. Support handovers and audit preparation with the full trail.

05 Separate claim from fact
Guessed, proposed, agreed and locked states make clear what is still uncertain and what has been accepted.

06 Check AI delivery claims
Verify checks “tested”, “committed” and “pushed” against evidence. Advisory findings guide human review.

IN PRACTICE / SUPPLIER-TO-MAINTENANCE HANDOVER

A supplier submits a revised service document. The reviewer needs to know what changed before accepting the handover record.

01 / LINK	02 / COMPARE	03 / REVIEW	04 / RECORD
Requirement + source	Old + new information	Resolve the conflict	Named approval + history

Start with one workflow. Build trust in the record.

arvioniqs.com contact@arvioniqs.com

Scope & readiness: Defence examples are proposed administrative and engineering workflows, not certified operational deployments. Start with synthetic or approved non-classified data. No defence accreditation, airworthiness certification or classified-data approval is claimed.

Record: invite-only. Verify: tested core for Claude Code on Linux; checks are advisory. Shared product-family integration is planned.
